

Balanced float valve with diaphragm actuated.

Description

- **Performances:**
 - Balanced type valve,
 - Progressive operation without friction,
 - Low head loss.
- **Design:**
 - Compactness,
 - 316 L stainless steel float,
 - Fully epoxy coated.
- No adjustment required.
- Maintenance-free.
- WRAS approved model on request.

Applications

- Control of top water level in reservoirs and storage tanks:
 - Drinking water networks.
 - Fire protection.
 - Irrigation.
 - High rise building.

Technical data

- Range: DN 40 to 250.
- Max working pressure: 10 bar.
- Max working temperature: +1° to 65° C.
- Flange drilling ISO PN 10 according to standards EN 1092-2 and ISO 7005-2 (ISO PN 16 for PN 16 execution for DN 200 and 250).

Options

- Ductile iron made.
- Altitude setting.
- Bottom installation kit.
- PN 16.

Operation

A high resistance diaphragm balanced design with direct float and lever action compensates 90 % of the effect of the pressure on the main valve, with no risk of rubbing or sticking. Hence, the valves operating action is very smooth and only requires a relatively small float and mechanical parts.

The slight remaining pressure tending to open the valve (10 %), prevents vibrations and damps down the effects of rapid operations. The high lever-arm demultiplication factor results in the device being highly insensitive to oscillations on the water surface. The device is simple, robust, and requires no adjustment.

Item	Desig.	Qty	Materials	Standards

* DN 80 drilling 4 or 8 holes

Mounting

Check that the emplacement provided for in the wall of the reservoir coincides with the table (especially with respect to distance E, for which only a tolerance of ± 20 mm should be allowed).

Before positioning the device, thoroughly flush the pipeline.

The lever arm and float are delivered in kit-form.

For installation at the bottom of the reservoir, use the

complementary kit consisting of: a 4 m stainless steel chain, two attaching clamps and two hook pieces. Distance H' (lever-arm swing) must be respected. If the working pressure is greater than 1 bar, we strongly recommend the installation of a stilling well (PVC, steel, iron, concrete, asbestos) as shown in figure below. The function of this tube is to eliminate too great a disturbance of the water-surface upon closing the valve.

Recommended flow rate / sizing

Two cases to choose the diameter according to the flow rate:

- When inlet pressure is low (≤ 1 bar) we recommend to size the float valve according to case 1. Head loss in the fully open valve will be about 2 m WC.
- When inlet pressure is high, float valves be sized according to case 2. Head loss will be about 5 m WC.

There is a progressive variation in flow rate with respect to the water-level, from the point where the device is fully open (H') to the valve being closed (H) (see Mounting figure).

Flow rates in l/s

DN	40	50	60/65	80	100	125	150	200	250
Case 1	2	3	4	7,5	12	18,5	26,5	47	74
Case 2	3	5	7	12,5	20	31	44	78,5	123

Altitude setting option

Only for DN 40 to 100, 25 mm step setting.
